HINTS TO TEACHERS.

1. Use natural objects (numeral frame, etc.) to give first notions of numbers. First, teach carefully the analysis of elementary numbers (with their notation) up to *nine* inclusive—so as to give clear notions of addition, subtraction, multiplication and division.

2. In addition etc., let the pupil have plenty of drill in *small numbers*, till he thoroughly comprehends the elementary processes. *Types of easy questions* are given in the book—let similarly easy questions be framed by the teacher, and by the pupils for mutual drill.

3. Give many *practical* questions, so that ultimately when a problem is prepared the pupil will be able to know in an instant which of the fundamental rules, or what combination of them, is to be applied in the solution.

4. Always proceed from the known to the unknown. The pupil learns subtraction from his knowledge of *addition*, etc., etc.: knowing that $4 + 3 = 7$, he knows that $7 - 3 = 4$, and that $7 - 4 = 3$; knowing that $4 \times 3 = 12$, he knows that 12 contains 4, 3 times, and 3, 4 times, etc.

5. In the "simple rules," prepare the way for fractions; make young scholars familiar with *factors*, *multiples*, *measures*. The pupil having become thoroughly familiar by proper training in the simple rules, with the notion of *division into equal parts*, and with the language expres-

ing such division, will find but little difficulty in the whole subject of fractions.

6. In general, pupils should not be permitted to use a text-book during recitation—young pupils need no book ; those who have advanced to division, analysis, etc., will do better to prepare assigned lessons, and at the same time, should have additional questions proposed corresponding to the given types.

7. In addition to daily oral work, there should be *frequent* written examinations ; the pupils are furnished with pencils and small slips of paper ; they are directed to turn to certain questions, to write down on their slips the numbers of these questions, and are then allowed a given time to solve them mentally, using the pencil only to write, opposite its number, the *answer* they have found for any question.

8. The pupil should commence mental arithmetic when he enters school, and should continue it so long as it is thought necessary that arithmetic should be one of his studies.

Section I.—Fractions.

INTRODUCTORY.

EXAMPLES.—1.

1. If anything, as a foot, a dollar, a pound, a number, &c., is divided into two equal parts, each part is *one-half* of the thing divided; if it is divided into three equal parts, each is *one-third*, and two of the parts are *two-thirds*; if it is divided into four equal parts each is *one-fourth*, *two* of them are *two-fourths*, and three of them *three-fourths*; if it is divided into five equal parts, each is *one-fifth*, two

of them are *two-fifths*, three of them *three-fifths*, four of them *four-fifths*; and so on for other divisions. Now, instead of *words*, we may use figures to express one or more of the equal parts into which the thing has been divided, thus:—

One-half is represented by $\frac{1}{2}$, *two halves* by $\frac{2}{2}$; one-third is represented by $\frac{1}{3}$, *two-thirds* by $\frac{2}{3}$, *three-thirds* by $\frac{3}{3}$; one-fourth is represented by $\frac{1}{4}$, *two-fourths* by $\frac{2}{4}$, *three-fourths* by $\frac{3}{4}$, *four-fourths* by $\frac{4}{4}$; one-fifth is represented by $\frac{1}{5}$, *two-fifths* by $\frac{2}{5}$, *three-fifths* by $\frac{3}{5}$, *four-fifths* by $\frac{4}{5}$, *five-fifths* by $\frac{5}{5}$; one-twelfth is represented by $\frac{1}{12}$, *two-twelfths* by $\frac{2}{12}$, *five-twelfths* by $\frac{5}{12}$, *seven-twelfths* by $\frac{7}{12}$, *eight-twelfths* by $\frac{8}{12}$, &c. In these expressions the lower figure shows the *number of parts* into which the thing is divided, and indicates the *fractional unit*, (one-half, one-third, one-fourth, &c.); the upper figure expresses a certain number of these equal parts, or *fractional units*. The thing which is divided into equal parts may be called the **UNIT OF THE FRACTION**.

2nd Sol.— $\frac{3}{4} = \frac{15}{20}$ and $\frac{2}{3} = \frac{8}{20}$; but 15 units of any kind divided by 8 units of the same kind $= \frac{15}{8}$.
 $\therefore \frac{3}{4}$ (or $\frac{15}{20}$) divided by $\frac{2}{3}$ (or $\frac{8}{20}$) $= \frac{15}{8}$ (or $\frac{3}{4} \times \frac{5}{2}$).
